# LP GAS: Prevent accidents

### Remember...

LP gas is very important in our everyday lives. Accidents can be prevented: check gas installation, cylinders, and tanks. The latter must receive periodic maintenance, be painted to avoid corrosion, and have old valves changed for new ones

#### Be safe, don't accept cylinders when they show:

- Leak
- Valve damage
- Corrosion
- Non-professional repairs (welding)
- A deformed or corroded bottom
- No valve protection collar
- Broken handle (to close/open valve) or there is no handle

#### **Cylinder fill-up**

Must take place at the distribution plant. Current standards prohibit filling-up at an LP gas supply station or at a street distribution car tank. This is dangerous because there are no controls and no safety conditions:

- There may be leaks and deadly accidents
- When overfilling occurs, gas is expelled without control
- Gas cylinders undergo no good condition checks, since they are not checked at the distribution plant

## **Handling LP gas**

A serious matter

# Cylinders used at fixed and semi-fixed locations on the Street, must:

Be fitted with metallic shield reinforced hoses

Be fitted with a pressure regulator

Have an additional quick shut-off valve, besides the one in the cylinder

Have only one with a maximum capacity of 20 kilograms

## LP gas accidents in Mexico (2010-2016)

**283**Transportation

46.85%

261

Urban **43.21 %** 

**60** Industrial

9.93%

**604** accidents

### Please also remember

to keep it at least 1.5 m away from fire, sparks, or heat sources

SS,

use appropriate tools to keep fittings in good condition 3

keep a dry chemical powder fire extinguisher with at list 4.5 kg, that works properly and has easy access

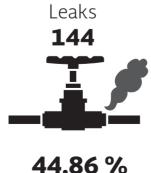

## Reasons for LP gas urban accidents

1. Home and business accidents reported, with no additional information

2. Includes accidents during a distribution tank vehicle supplies
